

Seb's Homework – 6th January 2016

Easy:

Write a program to print out all of the times tables, from 1 to 13, going up to 13 x 13.

Use the tab “\t” and/or field widths e.g. “%5d” to space things out and line them up neatly

Have a couple of blank lines in between the tables.

Much Harder:

Use while loops in a similar way to print out truth tables for logical AND and logical OR.

You will need a function `printBoolean(bool aBoolean)` will print out “true” or “false” depending on its argument.

Hint: It is difficult to use boolean types as a loop counter, so use integers instead. You will need to use the fact that integer 0 is seen as “true” and integer 1 as “false”
